

The Hasko End Matcher Difference

Hasko Chain

Competitors Chain

As the leader in our field a major advantage that Hasko has over the competitors is the independent “Stand Alone” guided chain with rigid, multiple interlocking fingers, incorporating very precise machining. Since Hasko sweep bars float, our chain provides square and accurate profiles without assistance or influence from another chain.

The competitors use a dependent dual chain system with fixed cross bars where the significantly less expensive two smaller chains must be kept adjusted to run together. End matcher squariness is dependent on the chain on the other side. These chains require much more maintenance and frequent replacement because single ear design wears faster and chains fail to maintain squariness.
